## DIJAGNOSTIKA MASTITISA

U slučajevima akutnih mastitisa nije teško postaviti dijagnozu i prepoznati bolest, jer su prisutni sledeći znaci:

- otok vimena
- toplo i bolno vime
- crvenilo vimena
- poremećeno opšte stanje grla
- promjena u izgledu mlijeka

Problem predstavljaju subklinički mastitisi. Kod životinja zahvaćenih ovim oblikom mastitisa ne uočavaju se klinički znaci oboljenja koji su gore navedeni, kao ni promjene u izgledu mlijeka. ponekad se u podmaklim slučajevima subkliničkih mastitisa može uočiti asimetrija vimena ili otkriti starija upalna žarišta u vidu čvorića u vimenu.

Dijagnostički postupci za otkrivanje mastitisa dijele se u dvije grupe:

### 1. Postupci prilagođeni terenskim uslovima

- Klinički pregled vimena
- Pregled mlijeka na crnoj podlozi

Pregledom prvih mlazeva mlijeka na crnoj podlozi moguće je uočiti krpice ili ugruške koji se ponekad javljaju na početku upale.

- Mastitis test

Mastitis test se zasniva na promjeni konzistencije mješavine tečnosti između mastitis reagensa i mlijeka u zavisnosti od broja somatskih ćelija u mlijeku.

### 2. Laboratorijske metode

- Brojanje somatskih ćelija
- Mikrobiološki pregled

Mlijeko normalno sadrži određen broj somatskih ćelija. Ove ćelije potiču iz krvi i mliječne žlijezde. Broj somatskih ćelija se u velikom broju povećava kod upale vimena. Zbog toga se određivanje somatskih ćelija koristi kao indikator subkliničkih upala vimena.

U pojedinim periodima imamo i kod zdravog vimena povećanja broja somatskih ćelija i to neposredno pred teljenje i zasušenje, ali u svim četvrtima vimena. I pored nekih slabosti utvrđivanje broja somatskih je najčešće primjenjivana metoda kontrole zdravlja vimena u laboratoriji. Isto tako, bakteriološki pregled bez podataka o broju somatskih ćelija ne može u potpunosti potvrditi sumnju o postojanju mastitisa. Bakteriološki pregled nam pruža samo informaciju je li četvrt inficirana ili ne, i kojom bakterijom.
